## What is VU™ Sign?

It is a solution that allows users to sign and verify documents both digitally and remotely.

### Characteristics:

- Through the API, VU Sign® can be easily integrated with customer-owned or third-party solutions.
- The web application is compatible with any desktop and mobile device.
- It simplifies document signing and verification flow.
- The installation process is quite simple and does not require any plugins.

## ¿Como funciona?

### Signature:

When signing the document, the system creates a unique digital fingerprint for the document, called hash. The hash is encrypted using the signer's private key, and any change, no matter how minor it may be, will result in a different hash.

### Verification:

VU™ Sign takes the signer's public key, included in the digital signature, to decrypt the hash of the document and create a new one. If the new hash matches the decrypted hash, it means that the document has not been altered.
